

$$1. 20x \equiv 45 \pmod{55}$$

$$4x \equiv 8 \pmod{11}$$

$$\frac{4}{4} \cdot \frac{x}{x} \equiv \frac{8}{4} \pmod{11}$$

$$x \equiv 2 \pmod{11}$$

$$55 = 5 \cdot 11$$

gcd all terms 5

$$\gcd(4, 11) = 1$$

$$2. 1600000x + 98349211y = 93649732423$$

yes bc gcds probably
from digit ending

$$3. 45 \mid a^{13} - a \quad \forall a \in \mathbb{Z}$$

$$45 = 13 \cdot 5$$

~~equivalent~~ equivalent congruence

$$a^{13} \equiv a \pmod{45}$$

equivalent simultaneous congruence

$$a^{13} \equiv a \pmod{13}$$

$$a^{13} \equiv a \pmod{5}$$

$$\phi(5) = 5 - 1 = 4$$

True by Fermat's theorem
as 13 is prime

By defn. prime $\gcd(5, a) = 1$

$$a^{14} \equiv 1 \pmod{5}$$

$$a^4 \equiv 1 \pmod{5} \quad \checkmark$$

By Fermat's theorem again

$$5 \mid a$$

Trivially holds

$$0^{13} \equiv 0 \pmod{5}$$

$$0 \equiv 0 \pmod{5}$$

Because all components of the ^{equiv.} congruence hold, they must be divisible.

$$r \cdot \sum_{d|n} \mu(d) \tau(d) = (-1)^r \quad \text{for some } r?$$

$$4. 19 \cdot (99!) - 6!$$

$$701 \mid \downarrow$$

$$19 \cdot (701-2)! \equiv 6! \pmod{701}$$

$$19 \cdot (701-2)! \equiv 30 \cdot 24 \equiv 720 \equiv 19 \pmod{701}$$

$$\gcd(19, 701) = 1$$

$$(701-2)! \equiv 1 \pmod{701}$$

$$\times 701$$

$$(701-1)! \equiv -1 \pmod{701}$$

True via Wilson's Theorem

$$5. -2^{125} \pmod{77}$$

$$77 = 7 \cdot 11$$

$$30 \cdot 19 \cdot 30 \cdot 4 \cdot 12$$

~~Wilson's Theorem is multiplicative~~

c. $\sum_{d|n} \mu(d) \tau(d) = (-1)^r$ for some r ?

~~q~~ ~~is~~ $\mu(d) \tau(d)$ is multiplicative because both μ and τ are multiplicative. thus

$$f(mn) = \mu(mn) \tau(mn) = \mu(m) \mu(n) \tau(m) \tau(n) = f(m) f(n)$$

Because of this name, the $\sum_{d|n} f(d)$ is multiplicative (when f is)

Thus wlog we can choose to operate only on primes

~~prime~~ prime powers are dominated by the $\mu(n)$ function
thus we don't need to worry of that case

for prime p

$$\sum_{d|p} \mu(d) \tau(d) = \mu(1) \tau(1) + \mu(p) \tau(p) = (-1)(2) + 1 \cdot 1 = 1$$

Because function is multiplicative, it will always return 1 (true $p \equiv 0 \pmod{2}$)

~~$$\sum_{d|12} \mu(d) \tau(d) = \mu(1) \tau(1) + \mu(2) \tau(2) + \mu(3) \tau(3) + \mu(4) \tau(4) + \mu(6) \tau(6) + \mu(12) \tau(12)$$~~

~~$$= (-1) \cdot 2 + (-1) \cdot 2 + 1 \cdot 3 + 1 \cdot 1 + 1 \cdot 4 + 1 \cdot 1 \neq 1$$~~

~~$$= 3 \cdot (-2) + 1 \cdot 4 + (-1) \cdot 3 \neq 1$$~~

$$7. f(n) = \sum_{d|n} \sigma(d) \quad \forall n \geq 1$$

$$f(2^{100} \cdot 77) = ?$$

$$f(2^{100} \cdot 77) = \left(\left(\frac{2^{101}-1}{2^{100}-1} \right) \left(\frac{2^{100}-1}{2^{99}-1} \right) \cdots \left(\frac{2^2-1}{2-1} \right) \left(\frac{77^2-1}{77-1} \right) \right)^2$$

$$6(n) = \left(\frac{2^{101}-1}{2^{100}-1} \right) \left(\frac{77^2-1}{76} \right) = \left(\prod_{i=1}^{100} \left(\frac{2^{i+1}-1}{2^i-1} \right) \right)^2 \left(\frac{77^2-1}{76} \right)^2$$

8. order of 2 mod 23

at most or factor of it

$$\phi(23) = 23-1 = 22$$

22

$$\phi(23) = 22 \leq 22$$

$$22 = 2 \cdot 11$$

$$22 = 2 \cdot 11$$

$$2^2 = 4 \times 2^{11} = 2048$$

the order of 2 mod 23

$$11 \text{ as } 2^{11} \equiv 1 \pmod{23}$$

9. $2^n - 1$ pseudoprimes? $n | \phi(2^n - 1)$

$$\text{for } n > 1, 2^n - 1 \equiv 3 \pmod{4}$$

~~these are not pseudoprimes~~
